

**01** FINDER

Get Organised

- One master folder: *Mistaken*
- Three subfolders: Audio, Images, Video
- Add as you go: verse, chorus, b-roll, motion guides

Hot tip: name every file by where it sits in the song — *chorus-01-line-01*. At 100 assets it saves hours.

02 SUNO

Lock the Song

- Finish the song completely — no more lyric or structure edits
- Make the clean radio version if needed
- Download the MP3 master into */Audio*

Hot tip: lock the song *before* you generate. Change the structure later and every clip after it breaks.

03 CHATGPT

Storyboard

- Find the visual in the lyrics
- Build the location, then place the character in it
- Variations of the *same* scene: close, medium, wide, high, low
- Generate B-roll stills while you are here

Hot tip: one performer only. A single target means better lip sync and far less drift.

04 IPHONE · SECRET SAUCE

Motion Guides

- You are the actor inside the avatar — film yourself performing
- Sing every line, move your hands, dance if they dance
- Record 4K or higher with the song playing out loud
- Match the guide's angle to the image's angle

Hot tip: the scratch audio doesn't need to be clean — it only has to sync in CapCut.

05 CAPCUT

Cut the Snippets

- Expand the track height, waveform to 100%
- Cut on the peak where the line starts and ends
- Right-click → export selected clip, 4K
- Name it *chorus-01-line-01*

The hack: one line per clip. Short generations mean less drift — and a failure only costs you one line.

06 OPENART · MOTION SYNC

Generate the Clips

- Motion Sync, model Kling 3.0
- Upload the image, then the guide snippet
- Keep the prompt simple, defaults on, Generate
- Change the image only when the song section changes

Hot tip: great visual but weak lip sync? Keep it. Cut away before the mouth moves and it becomes B-roll.

07 OPENART · START + END

Build the B-Roll

- Video → Start Frame → History for your uploads
- Start: the empty location. End: the character in place
- Same model as Motion Sync, one subtle prompt

Hot tip: keep B-roll to five seconds. In a music video that is a long time — short cuts carry the energy.

08 CAPCUT

The Final Edit

- New project at 60 fps, export at 24 / 25 / 30
- Master track dropped *off* the main timeline
- Waveform 100%, match the peaks, mute the guide, lock it
- Effects, masks, lyric captions, then export

Hot tip: mark the beats with *M*, then cut to them. That is where the energy comes from.
